Caddo-Bossier Windows User Group Newsletter

March 2007

February Meeting

By Glenda Conradi

David Huckabee, Bernie Conradi and Guest Speaker Jim Moore

Jim Moore was our guest speaker at the February meeting. His program topic was “Some of My Favorite Things”. He talked about Root Kits and shared information about some of his favorite software. One of the programs, SpooF Stick, reveals the actual name of a Web site. He mentioned that Power Archiver has an easy to use automated file back-up Wizard and the ability to upload back-ups to an FTP server.

Jim warned that it is extremely important to maintain original equipment software and do regular back-ups, in case you have problems with your computer that require professional help. Some technicians format your hard drive in order to correct problems and get your computer up & running. If that happens you will have to reload programs & restore data when you get your computer back.

March Program

By Glenda Conradi

Eddie Dunn will return as our guest speaker in March. Eddie, along with former C-B WUG member Rodney Brundrett recently formed Alpha Network and Developers LLC. Eddie is going to talk to us about developing software, and some of the procedures his company uses to come up with the right software for a client. He will go into some of the things you need to

know to set up a home network, and also give us some suggestions and tips on creating and maintaining a Web page. These are the three things his company specializes in for commercial customers, so he will adjust the information he shares with us more to a home users level. Questions welcome.

MEETINGS

Thursday March 8, 2007

Thursday April 12, 2007

Podnuh’s Bar-B-Que

1146 Shreveport-Barksdale Hwy
 Shreveport, Louisiana

*Meetings 2nd Thursday of each month
 7 p.m.*

MARK YOUR CALENDAR

Ark-La-Tex Computer Sheaux

The last Ark-La-Tex Computer-Sheaux was held November 11, 2006. Over \$160,000.00 was donated to the Shriners Hospital for Children since July 1994 when it was founded.

~Thank You~

Podnuh's Bar-B-Q 1146 Shreveport-Barksdale Hwy for letting our group hold our monthly meetings in a private dining room in their restaurant

ShreveNet, Inc. / Nationwide Internet for generously providing an email account and internet access for C-BWUG and for providing web space for our club.

BancorpSouth on Youree Drive for providing us with a checking account at no charge.

~A QUICK TIP~**Deleting Remembered Passwords in IE7**

You can delete the passwords remembered by Internet Explorer to ensure no one else can use private information that you have previously entered.

1. Within Internet Explorer, click Tools, and select Internet Options.
2. From the Internet Options dialog box, select the General tab.
3. Click the Delete button under Browsing History.
4. Click the Clear Passwords button. Click Yes to confirm your actions.

President's Page**Caddo-Bossier Windows Users Group February Meeting**

There were three visitors this evening. We welcomed Raymond Kidd, Bryan Allen and Setsko Graff. We hope will return again for another meeting. Glenda gave us a status of the ComputerSheaux that is currently pending to have a new type of show in August 2007, if all things can be worked out as to a new format. We reminded all that if you are considering upgrading your current computer to the new Windows Vista that you go to the Microsoft web page and download the Windows Upgrade Advisor. With this tool you can determine if your computer will run the new operating system. This report will tell you what hardware and software will work with Vista and what new drivers will be needed. Be sure to print out the report so you will have it available to use as a tool during the upgrade process. Jim Moore with Tech Services Computer Repair provided us with a very interesting and entertaining program for this month. The subject of his presentation was "Some of My Favorite Things". He informed us of some of his favorite free software, told us about root kits, free web browsers, how to select a password and what not to do when using a password, compression programs and some tips and tricks to use on your computer. His program was most enlightening and he made it a lot of fun to see. He also talked about a web site called, "youos.com". He recommended we all take a look at this site as a place to visit and use whether you are at home or traveling.

The door prizes were: a phone card won by Thelma Windham and a flip & file won by Bob Salts. This I ask anyone that has a subject in mind for a program, or a person that would be interested in providing a program to contact glenda@conradi.com with information so we can follow up and hopefully provide interesting and informative content to our upcoming programs.

Bernie Conradi, President Caddo-Bossier Windows Users Group.

Say What?

Jay Graff

A computer that talks to you. Sounds like a novel idea. Actually it is not that new. As far back as I can remember (the old C-64 days) it has been around. They had programs that would emulate speech and play it through your speakers. The only problem was that for one thing, not all programs would play the sound and more importantly, you only had the one voice and that was the flat one with absolutely no inflection. It had trouble with some of the words and some of the pronunciations sounded really foreign. Well, we are in a new era now and things have really improved. We are exposed to computer generated voices every day. And they have now figured out how to make them human sounding, so you can make it appear that virtually anyone is talking to you and it is only a computer...Enter a new program that I was told about from a friend, called Text Aloud. If you do a search, you will discover that there are a number of text to speech readers out there and this is only one of many. I have not really gotten into it, but I have played around with it to find out a little about it. They claim that it will read any text source and turn it into speech. I have not tried every source so I can't attest to that, but I did try a text document and it works pretty good. It reads and speaks the words pretty faithfully. When you install it, it also adds a line in your browser, so theoretically, you can highlight text in your browser and click on the icon that is there and have it read whatever it is that is highlighted. I believe that this program has a huge potential, although for now, it is still in the novelty stage, for me at least. But as with any program, there are drawbacks that must be considered. First, if you are a stickler for speed, you may be disappointed. I suppose there are a lot of actions that take place to turn your text into speech. Recently I accidentally clicked the icon in my

browser (Firefox) and I thought that my computer hung up. Finally, it came back and I think it took me to the site of the program. But the main problem I have with it right now is that when you download the trial version the only voice you get with it is that flat, no inflection one that I spoke of. The site sells a large number of additional voices that you can get at around \$35 a pop. The program costs around \$30, and if you got a few extra voices, you can see that you could soon run up a hefty bill. As I mentioned, this program has great potential, such as reading text to those with poor eyesight, as well as older people or even those that have trouble reading. If you are interested in this program, you can find out all about it at: Www.nextup.com. They also have samples of all of the voices available as well as information on how to purchase and download them

GETTING STARTED WITH XP

System Restore

There is a feature In Windows XP called System Restore. It will revert your computer back to a previous time, before you made a big mistake on your computer or before you installed a program that caused you problems. It lets you get your computer back to the way it was before the problem. To go to a restore point go to Start, All Programs, Accessories, System Tools, System Restore. To make a restore point to a specific time, check the button next to "Create a restore point" and click Next. Type a short description you will recognize for your point. It could be to an installation or an update. When you're done, click Create and you will have a new restore point. The date and time will be added to your restore point, so your computer will have all the information it needs to get your computer back to normal.

Door Prizes Winners for February 2007 Meeting

Bob Salts and Thelma Windham

The February door prizes were won by Bob Salts, a disk holder and Thelma Windham, a long distance calling card. All Caddo-Bossier Windows User Group club members in attendance are eligible to win door prizes at the monthly meetings.

Flash Drives

By David M. Huckabee

In the old days, if you wanted to take files to another computer, you had to put a floppy disk in your computer and copy the files to it. This floppy disk was limited to the size of the file or files that you could take with you. If there was a lot of information that had to be transported, you had to somehow break the files up into a manageable size to go on the floppy. Most of the later 3 ½ inch floppies had a capacity of 1.44 megabytes (MB) of information. That was a lot of stuff on that little floppy disk and the disk didn't take up a lot of room in your purse or pocket. With our lifestyle we found that the little floppy didn't hold enough information so we started using CD's to transport our valuable stuff. One drawback was that the CD was a "use once" device. You placed your information on it and took it to wherever you needed it and put it on that computer. Now that you are through with the information you had to get rid of any private information that is on the CD. Blow torch, shred, drill holes in it, you just had to somehow guard against your information falling into someone else's hands. You were still faced with size limitations, since you are carrying more information now. The CD's could only handle 650-700 MB, but they were CHEAP. If you had to carry more information you might use a DVD or more CD's. If you used DVD's the target computer may not have a DVD player and you have wasted time and a more expensive piece of plastic. Of course you could transfer your information on the Internet or e-mail that "SECRET" stuff to your friend; no one would ever see what you are sending. In recent years there has been a little device that is becoming quite useful for the computer user; that device is the USB flash drive. Whether you call it a flash drive, travel drive, or that little "thingy" you plug into the com-

puter, this is quite useful for many applications. As of November 2006, memory capacities for USB flash drives currently are sold from 32 megabytes up to 64 gigabytes. I personally have not seen any true flash drives larger than 4 gigabytes. They say that the 64 gigabyte flash drive is \$5000; that's a lot of cash for something you could lose easily. The one gigabyte flash drives can be found on sale for around \$20. The Windows 2000, XP, and Vista operating systems do not require drivers to use the flash drives, other operating systems may require a driver. These little wonders plug into your USB port on your computer and are recognized as a hard disk drive. Some of the devices that look like a larger flash drive and have larger capacities are just miniature hard drives, they may not be as fast, but who cares, "you got your stuff with you." There are flash drive manufacturers that have bundled software with their drives in co-operation with outside vendors. U3 (www.u3.com) is a vendor that has become a large supplier of flash drive software. The drives are especially equipped to use the U3 software from other software manufacturers and the drives are branded with the U3 logo. These drives can be used as a key to lock your laptop or desktop computer and the drive is the key to unlock. The flash drive can carry your passwords to all of your websites that you frequent (bank, credit card, or department store) and you can be assured that the passwords will not be stolen because they are encrypted on the flash drive. Some of the computer company support people carry their utility programs on the flash drive, a small, easy to carry toolbox you carry in your pocket. These little wonders have become a useful tool at a relatively small price and they can be erased and reused.
